Energy Balance in Closed Systems

Energy Change = Heat + Work

$$\Delta E = \Delta(U + E_p + E_c) = Q + W$$

- 1st Law: Energy Conservation
- Forms of E: U, E_c and E_p
- Energy transfer by Q and W
- Sign of heat and work fluxes

Moran et al., 2014

INSTITUTO
SUPERIOR
TÉCNICO

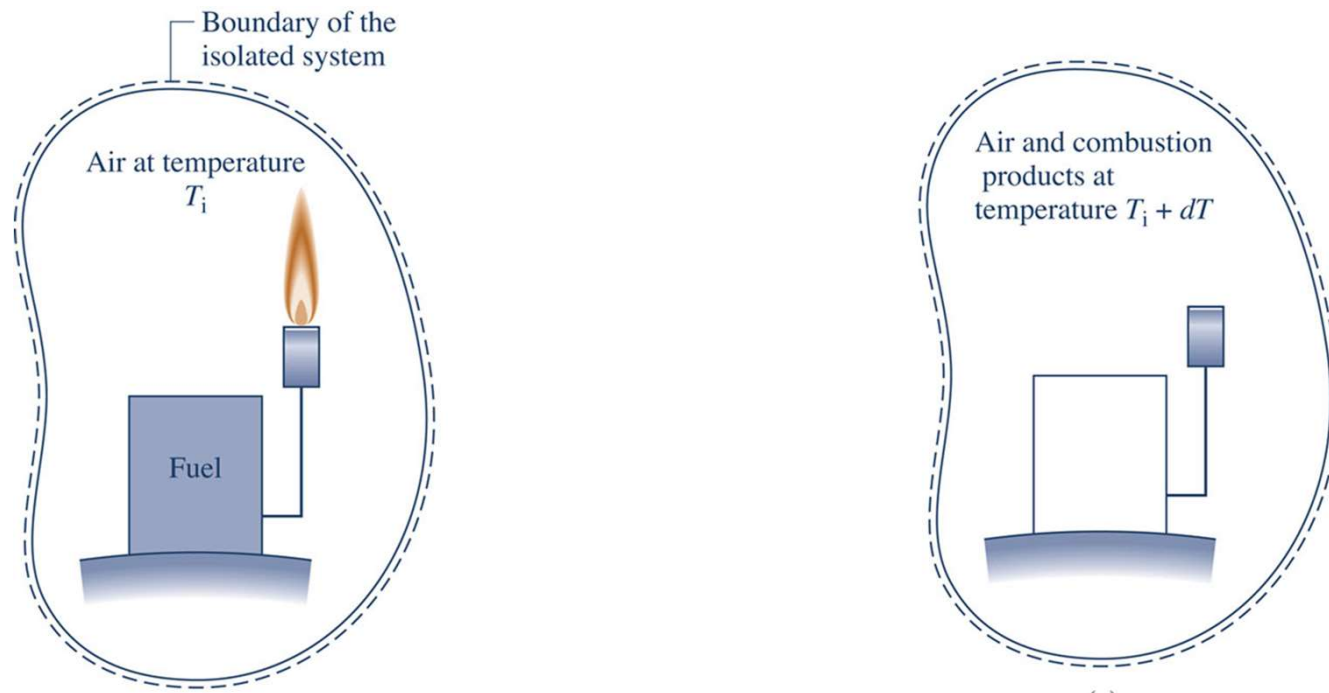

Energy Balance in Closed Systems

Energy Balance in isolated systems

- What happens to the total energy of the system?

Moran et al., 2014

Energy vs. Exergy

- What happens to the total energy of the system?

- It remains constant (system is isolated)

Energy vs. Exergy

- Can the process occur from the right to the left?

INSTITUTO
SUPERIOR
TÉCNICO

Is the first law enough?

- What happens if you put a dish with ice over a pan with boiling water?

SUPERIOR
TÉCNICO

Entropy Balance in Closed Systems

INSTITUTO
SUPERIOR
TÉCNICO

Entropy Balance in Closed Systems

Entropy change = Entropy transfer in the form of heat + entropy production

$$\Delta S = \frac{Q}{T} + (\sigma)$$

Entropy flows with heat but not with work

INSTITUTO
SUPERIOR
TÉCNICO

Entropy Balance in Adiabatic Systems

- Suppose the combined system (contained in the black boundary) is adiabatic and that $T_2 > T_1$
- What happens to the entropy of the combined system in each case?

INSTITUTO
SUPERIOR
TÉCNICO

Entropy Balance in Adiabatic Systems

$$\Delta S = \sigma > 0$$

$$\Delta S = \Delta S_1 + \Delta S_2 = \frac{Q}{T_1} - \frac{Q}{T_2}$$

$$\Delta S = \sigma > 0$$

$$\Delta S = \Delta S_1 + \Delta S_2 = \frac{Q}{T_2} - \frac{Q}{T_1}$$

Entropy Balance in Adiabatic Systems

- 2nd Law: In an adiabatic system the entropy cannot decrease

- 2nd Law: the arrow of time
- Entropy production in spontaneous processes

Entropy

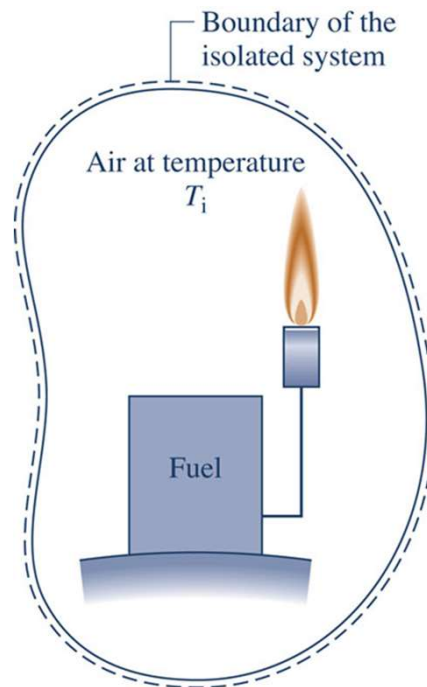

- What happens to the total entropy of the system?

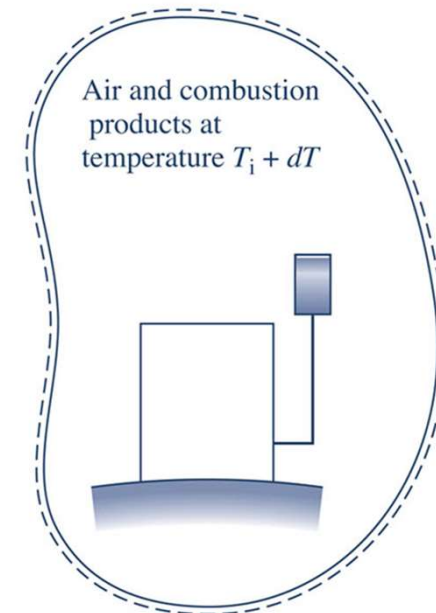

Energy vs. Exergy

- Which system has a greater potential for use?

Fuel-air combination

Warm air mixture

Energy vs. Exergy

- Which system has a greater potential for use?

Fuel-air combination

Warm air mixture

- “The fuel might be used to generate electricity, produce steam, or power a car whereas the final warm mixture is clearly unsuited for such applications.”

Energy vs. Exergy

- Which system has a greater potential for use?

Fuel-air combination

Warm air mixture

- “During the process the initial potential for use (and economic value) is predominately *destroyed* owing to the irreversible nature of that process.”

INSTITUTO
SUPERIOR
TÉCNICO

Energy vs. Exergy

- Exergy is the property that quantifies **the potential for use** and it is exergy that has economic value.
- Exergy is a property that takes into account the second law of thermodynamics
- **How can we make use of a body at $T_i > T_0$?**

INSTITUTO
SUPERIOR
TÉCNICO

Energy vs. Exergy

- Controlled cooling to produce work

Moran et al., 2014

INSTITUTO
SUPERIOR
TÉCNICO

Energy vs. Exergy

- Controlled cooling to produce work

Moran et al., 2014

- The amount of maximum work depends on what?

INSTITUTO
SUPERIOR
TÉCNICO

The Carnot Efficiency – Power Cycle

INSTITUTO
SUPERIOR
TÉCNICO

The Carnot Efficiency – Power Cycle

- **First law:** $\Delta E = Q_H - Q_C - W_{cycle} = 0 \Rightarrow W_{cycle} = Q_H - Q_C$
- **Second law:** $\Delta S = \frac{Q_H}{T_H} - \frac{Q_C}{T_C} + \sigma = 0 \Rightarrow Q_C \neq 0$
- **Ideal (Reversible) Cycle:**

$$\Delta S = \frac{Q_H}{T_H} - \frac{Q_C}{T_C} = 0$$

$$\eta_{ideal} = \frac{W_{cycle}}{Q_H} = \frac{Q_H - Q_C}{Q_H} = 1 - \frac{Q_C}{Q_H} = 1 - \frac{T_C}{T_H}$$

Energy vs. Exergy

- Controlled cooling to produce work

Moran et al., 2014

- Exergy is the maximum theoretical value for the work W_c .
- What happens to the exergy of the body with time?

Energy vs. Exergy

- Controlled cooling to produce work

Moran et al., 2014

- Exergy is the maximum theoretical value for the work W_c .
- What happens to the exergy of the body with time?

INSTITUTO
SUPERIOR
TÉCNICO

Energy vs. Exergy

- Could we produce work if $T_i < T_0$?

INSTITUTO
SUPERIOR
TÉCNICO

Energy vs. Exergy

- Could we produce work if $T_i < T_0$?

Moran et al., 2014

- The potential for developing work W_c exists because the initial state of the body differs from that of the environment, i.e., $T_i < T_0$.

INSTITUTO
SUPERIOR
TÉCNICO

Defining Exergy

- Reference environment: T_0 and P_0
- Exergy is the maximum W_c obtainable from the system plus the environment as the system comes into equilibrium with the environment (goes to the dead state T_0 & P_0).
- What happened in the case of spontaneous cooling?

Defining Exergy

- Reference environment: T_0 and P_0
- Exergy is the maximum W_c obtainable from the system plus the environment as the system comes into equilibrium with the environment (goes to the dead state T_0 & P_0).
- W_c is null because exergy is destroyed by irreversibilities (spontaneous processes)

INSTITUTO
SUPERIOR
TÉCNICO

Defining Exergy

- If temperature and/or pressure of a system differ from that of the environment, the system has **thermomechanical** exergy. Another contribution, called **chemical exergy**, arises when there is a chemical composition difference between the system and environment.

INSTITUTO
SUPERIOR
TÉCNICO

Exergy Balance in Closed Systems

$$\frac{E_2 - E_1}{\text{exergy change}} = \frac{\int_1^2 \left(1 - \frac{T_0}{T_b}\right) \delta Q + [W + p_0(V_2 - V_1)] - T_0\sigma}{\text{exergy change}}$$

Exergy Balance in Closed Systems

- Exergy transfer by heat
 - What is the maximum amount of work that can be produced with Q ?

Exergy Balance in Closed Systems

- Exergy transfer by heat
 - What is the maximum amount of work that can be produced with Q ?

$$W_{max} = \int \left(1 - \frac{T_0}{T_b} \right) \delta Q$$

Cengel & Boles

$$E_q = \left[\begin{array}{c} \textit{exergy transfer} \\ \textit{accompanying heat} \\ \textit{transfer} \end{array} \right] = \int_1^2 \left(1 - \frac{T_0}{T_b} \right) \delta Q$$
